

xAssets Announces xAssets for SCCM

Red Bank, NJ March 22, 2011 - xAssets LLC announced today the availability of xAssets for SCCM, which is an adaptation of xAssets' IT Asset Management solution, that provides an out-of-the-box reporting solution for SCCM customers. The application facilitates the integration with other IT systems including Active Directory, Help Desks and other discovery tools, enabling IT professionals to develop a holistic view of the IT infrastructure in one easy to use browser based application. The software is scalable to meet the needs of the largest enterprises and is available as a cloud-based solution or as a traditional installed enterprise application.

Barry Long, xAssets US Sales Director noted; "We realized that we had a powerful adjunct to any company's use of SCCM with our ITAM product which we have now defined and enhanced as 'xAssets for SCCM'. It provides significant benefits to any company looking to save more money by combining our product functionality with what they already have. This full lifecycle product is worth a close look by any company using SCCM, not only because of the xAssets products and company history of being highly configurable and robust with very comprehensive customizable reporting capabilities, but also because of how fairly priced the products are in the marketplace today, whether in the Cloud or installed. "

xAssets for SCCM includes all of the components needed to discover non-domain Windows® nodes, Linux®, Unix® and Apple Macintosh® devices, network equipment, VOIP phones and printers, along with all Windows-based devices. As a result, a SCCM domain based Windows endpoint inventory can easily be extended to cover all IP based IT Assets. xAssets' customers can also manually enter or import assets from other sources, either as a scheduled job or as a one-time import. Software Asset Management is included as part of xAssets for SCCM and an optional Service Management application supporting advanced help desk and service management is also part of solution. xAssets for SCCM provides the same capabilities as xAssets' discovery toolset and includes coverage of the entire asset lifecycle from Procurement through Service, RMA and Reuse, and through to Disposal.

xAssets for SCCM sits at the center of a customer's IT operations as a centralized data repository (CMDB) of Asset and Service information. Every IT department can access the system via a web browser to get up-to-date asset information. xAssets collects information from a wide range of sources and databases to provide a complete and up-to-date IT asset repository.

xAssets for SCCM is based on the xAssets Enterprise Framework, which is the most configurable and scalable Asset Management Software available. Menu items, queries, profiles, integrations, data movements, triggers, business rules, reports, forms and processes can be configured from within the user interface. This flexibility makes the software ideal for large enterprises with complex requirements, whilst also providing the flexibility for IT professionals to configure the system to meet their exact requirements.
